

# “BT Dial” Chrome Extension

## Overview

The “BT Dial” Chrome extension provides click-to-dial functionality on all web pages. It also pairs well with the HTML directory pages that are available under the LDAP tab on the main system configuration GUI. Print a page of your contacts and you now have a click to dial means of dialing them - more about this later.

The extension works as follows:

- All possible phone numbers on a web page will be highlighted.
- Click on any of these numbers and your desk phone will ring.
- Answer the call and you will be connected to the number you clicked.

## Installation

You can download the app by:

- Going to the Chrome store and searching for “BT Dial”, or
- Simply click on this link:

<https://chrome.google.com/webstore/detail/bt-dial/pbbadloobpgdpeccioomcjmhkdkblec>

Once installed you will see a blue phone icon in the toolbar as shown in the figure on the right.

Click on the icon and do this:

- Enter the same data in the fields shown as you would to log into your account on the configuration web site.
- Press Save

For most people, that’s all there is to it. If you now go to a web page and use a standard left button click on a phone number and then your phone will ring! Pick it up to make the connection.

By default the system chooses the primary phone that is registered to the account. If you want to ring another phone then that’s fine provided it is a legitimate four digit extension on your account. To make this change right click on the “BT Dial” icon and select “Options”, you will see a pop up as illustrated below.

The pop-up has two text boxes:

- The “Web Server” textbox is primarily for developers and it’s unlikely you will ever need to edit this - ignore it.
- The “Preferred Extension” is where you will enter the extension number you would prefer “BT Dial” to call.
- Press “Save”

All click-to-dial calls will now be redirected to this new extension.
